Title:

The Fire Resistance Performance of a Loadbearing Timber Floor Assembly Protected by a Plasterboard Ceiling Designed to Provide 30 minutes Fire Resistance, Incorporating Twenty Three Downlight Fittings, When Tested Accordance with BS EN 1365 - 2: 2014

WF Report No: 385023-B

Prepared for:

Integral LED
Unit 6, Iron Bridge Close, Iron Bridge Business Park, London, NW10 0UF, UK

Date:

26th January 2018

Notified Body No:

0833

0249

This test report is additional to that issued as WF Test report No. 385023 and dated 15th December 2017. The original test report remains valid and is not replaced by this additional test report.

Summary

Objective

To determine the fire resistance performance of a loadbearing timber floor assembly protected by a plasterboard ceiling designed to provide 30 minutes fire resistance, incorporating twenty three down light fittings, when tested in accordance with BS EN 1365 - 2: 2014.

Sponsor

Integral LED
Unit 6, Iron Bridge Close, Iron Bridge Business Park, London, NW10 0UF, UK

Summary of Tested Assembly

Briefly, the timber floor had overall nominal dimensions of 4500 mm long by 3000 mm wide and comprised softwood timber joists at 600 mm centres. The upper surface of the floor comprised nominally 22 mm thick tongue and grooved chipboard flooring.

The floor assembly was protected on its underside by a direct fixed ceiling, formed from a single layer of 12.5 mm thick British Gypsum Fireline plasterboard, the ceiling was screw fixed to the underside of the floor joists.

The floor supported an evenly distributed load of 0.876 kN/m^2.

The ceiling incorporated 22 down lighter light fittings, 2 of which are subject to this test report and were referenced as follows:

Test Ref.	Model Ref.	Description
I	ILDLFR70AXXX	Round, fixed, LED recessed downlight
M	ILDLFR92CXXX	Round, tiltable, LED recessed downlight
A-H, J-L and N-W	Items reported separately	

Test Results:

Loadbearing Capacity	35 minutes*
Integrity Performance	
Sustained flaming	35 minutes*
Gap gauge	35 minutes*
Cotton pad	35 minutes*
Insulation	35 minutes*

*The test was discontinued after a period of 35 minutes.

Date of Test 24th August 2017

Report Issued

Date : 26th January 2018

This test report is additional to that issued as WF Test report No. 385023 and dated 15th December 2017. The original test report remains valid and is not replaced by this additional test report.

CONTENTS **PAGE NO.**

Test Procedure

Introduction

The specimen tested was of a loadbearing timber floor construction protected by a direct fix ceiling assembly. The test was conducted in accordance with BS EN 1365-2: 2014, 'Fire resistance tests for loadbearing elements – Part 2: Floors and Roofs'. This test report should be read in conjunction with that Standard and with BS EN 1363-1: 2012, 'Fire resistance tests part 1, general requirements' and BS EN 1363-2: 1999, 'Fire resistance tests part 2, alternative and additional procedures'.

The purpose of the test was to evaluate the performance of a timber floor construction protected by a ceiling of known fire resistance, when incorporating down lighter light fitting assemblies.

The specimen was judged on its ability to comply with the performance criteria for loadbearing capacity, integrity and insulation, as required by BS EN 1365-2: 2014.

Fire Test Study Group/EGOLF

Certain aspects of some fire test specifications are open to different interpretations. The Fire Test Study Group and EGOLF have identified a number of such areas and have agreed Resolutions which define common agreement of interpretations between fire test laboratories which are members of the Groups. Where such Resolutions are applicable to this test they have been followed.

Instruction To Test

The test was conducted on the 24th August 2017 at the request of **Integral LED,** the test sponsor.

Test Assembly Construction

A comprehensive description of the test construction is given in the Schedule of Components. The description is based on a detailed survey of the specimen and information supplied by the sponsor of the test.

Installation

Representatives of **Exova Warringtonfire** assembled the floor construction and installed the downlighters between the 21st and 24th August 2017.

Conditioning

The specimens' storage, construction, and test preparation took place in the test laboratory over a total combined time of 4 days. Throughout this period of time both the temperature and the humidity of the laboratory were measured and recorded as being within a range of from 18°C to 26.5°C and 55.5% to 80% respectively.

Schedule of Components

(Refer to Figures 1 to 4)
(All values are nominal unless stated otherwise)
(All other details are as stated by the sponsor)

Item		Description
1. Timber Floor		
1.1 Floor Joists		
Material	:	British Home-grown, rough sawn softwood, kiln dried
Grade	:	C16, to BS EN 519
Density	:	511 kg/m^3
Size	:	45 mm x 197 mm
Joist centres	:	600 mm
1.2 Noggins		
Material	:	British Home-grown, rough sawn softwood, kiln dried
Grade	:	C24, to BS EN 519
Density	:	511 kg/m^3
Size	:	65 mm x 45 mm
Joist centres	:	1200 mm
1.3 Floor Boards		
Material	:	Flooring grade tongue and groove chipboards
Reference	:	FSC E1 P5
Thickness	:	22 mm
Size	:	600 mm wide
Fixing	:	Fixed in a single layer with 6 mm diameter x 60 mm long countersunk steel screws to floor joists at 300 mm centres
1.4 Ceiling Boards		
Manufacturer	:	British Gypsum
Type / reference	:	Gyproc Fireline Wallboard
Density	:	803 kg/m^3
Thickness	:	12.5 mm thick
Fixing		
i. method	:	The boards were screw fixed to the soffit of the joists with all joints in the second layer staggered with respect to those of the first layer
ii. fixings	:	Drywall self drill and tapping screws 38 mm and 50 mm long for the 1st and 2nd board layers respectively
iii. frequency	:	150 mm centres along joints and 150 mm to the perimeter of the ceiling

Instrumentation

General	The instrumentation was provided in accordance with the requirements of the Standard.
Furnace	The furnace was controlled so that its mean temperature complied with the requirements of BS EN 1363-1: 2012, using eight plate thermometers distributed over a plane 100 mm from the underside of the test construction.
Thermocouple Allocation	Thermocouples were provided to monitor the unexposed surface of the floor assembly and the output of all instrumentation was recorded at no less than one minute intervals as follows:
Thermocouples 212 to 216	At five positions on the unexposed surface of the floor assembly, one approximately at the centre and one at approximately the centre of each quarter section.
Thermocouples 217 to 220 & 226 to 227	At six positions on the unexposed surface of the floor assembly, positioned adjacent to joints in the floor boarding.
Thermocouples 221 to 225	At five positions in the air cavity of the floor assembly, one approximately at the centre and one at approximately the centre of each quarter section. The locations and reference numbers of the various unexposed surface and internal thermocouples are shown in Figure 1.
Roving Thermocouple	A roving thermocouple was available to measure temperatures on the unexposed surface of the specimen at any position which might appear to be hotter than the temperatures indicated by the fixed thermocouples.
Furnace Pressure	After the first five minutes of testing and for the remainder of the test. The calculated pressure differential relative to the laboratory atmosphere 100 mm away from the underside of the assembly was 20(+0, -5) Pa between 5 and 10 minutes of testing and 20(+0, -3) Pa after 10 minutes of testing and for the remainder of the test.
Loadbearing Capacity Criteria	Linear deflection transducer was provided at the approximate centre on the unexposed surface of the specimen to record its vertical deflection.
Integrity Criteria	Cotton pads and gap gauges were available to evaluate the integrity of the floor assembly.

Test Observations

Time		All observations are from the unexposed face unless noted otherwise.
mins	**secs**	The ambient air temperature in the vicinity of the test construction was 21ºC at the start of the test with a maximum variation of +1ºC during the test.
00	**00**	**The test commences.**
04	**00**	Very light steam/smoke release is observed from latitude edges of the specimen.
07	**00**	When viewed from the exposed face, the paper face of the boards is observed charring away as small hairline cracks begin to form.
12	**00**	Steam/smoke release from the latitude edges increases.
14	**00**	When viewed from the exposed face, the joints between the boards are expanding.
17	**00**	Steam/smoke release from the latitude edges continues to slightly increase.
20	**00**	When viewed from the exposed face, the joints between the boards continue to slowly expand.
26	**00**	Steam/smoke release form the latitude edges continues to slightly increase.
31	**00**	When viewed from the exposed face, the joint between the boards continue to slightly expand.
35	**00**	**The test is discontinued.**

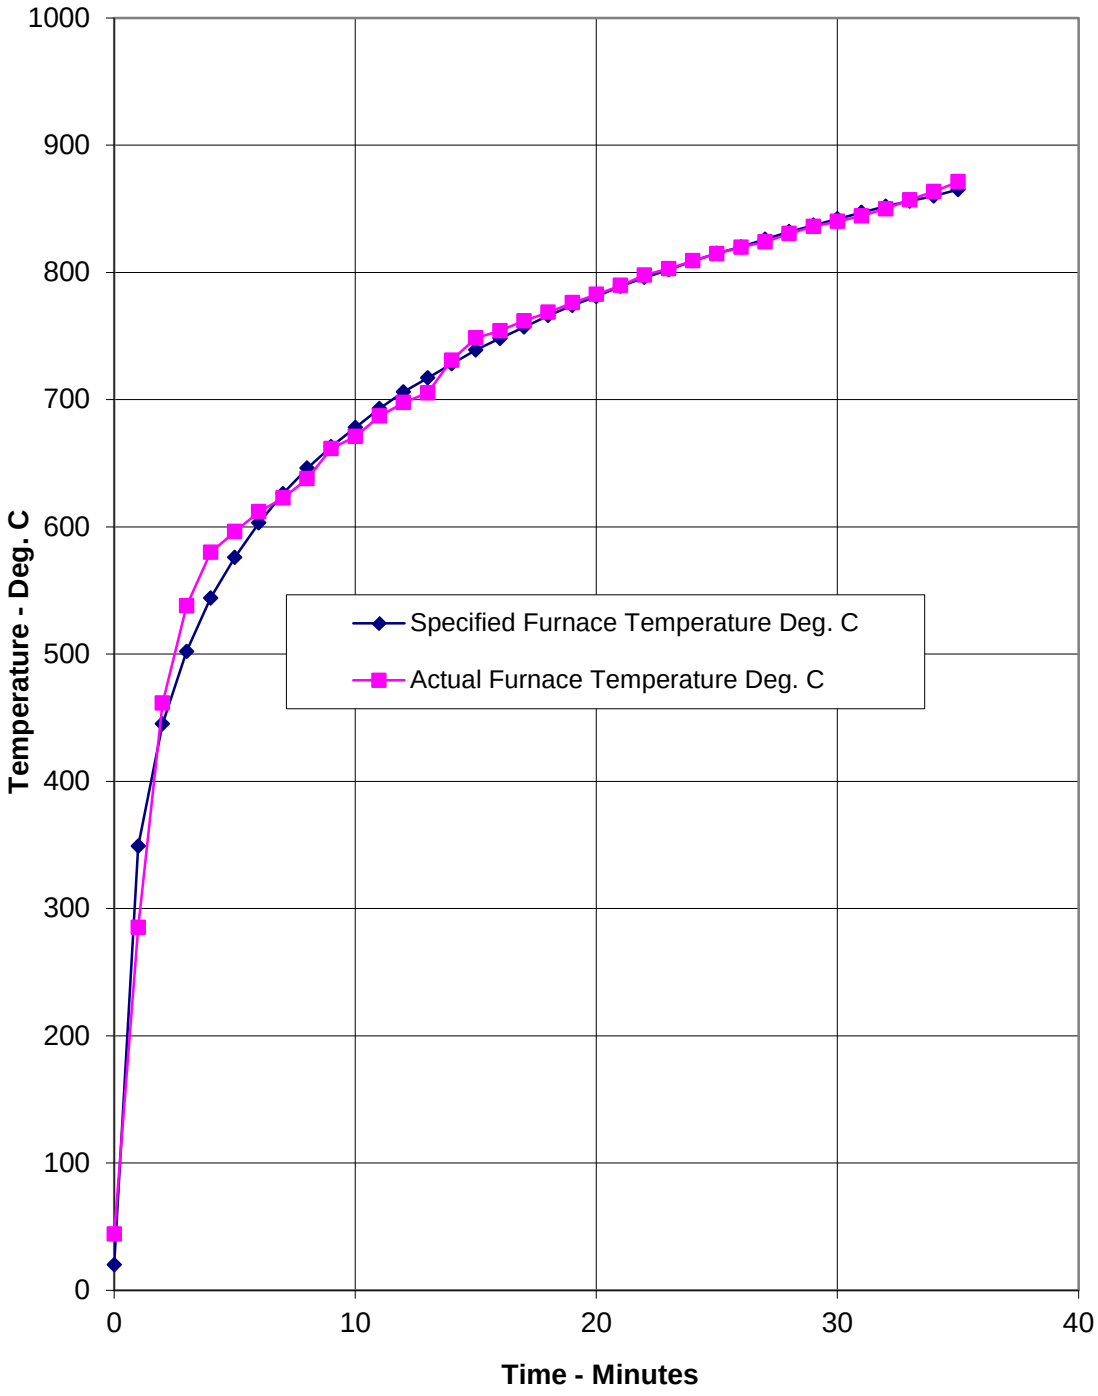
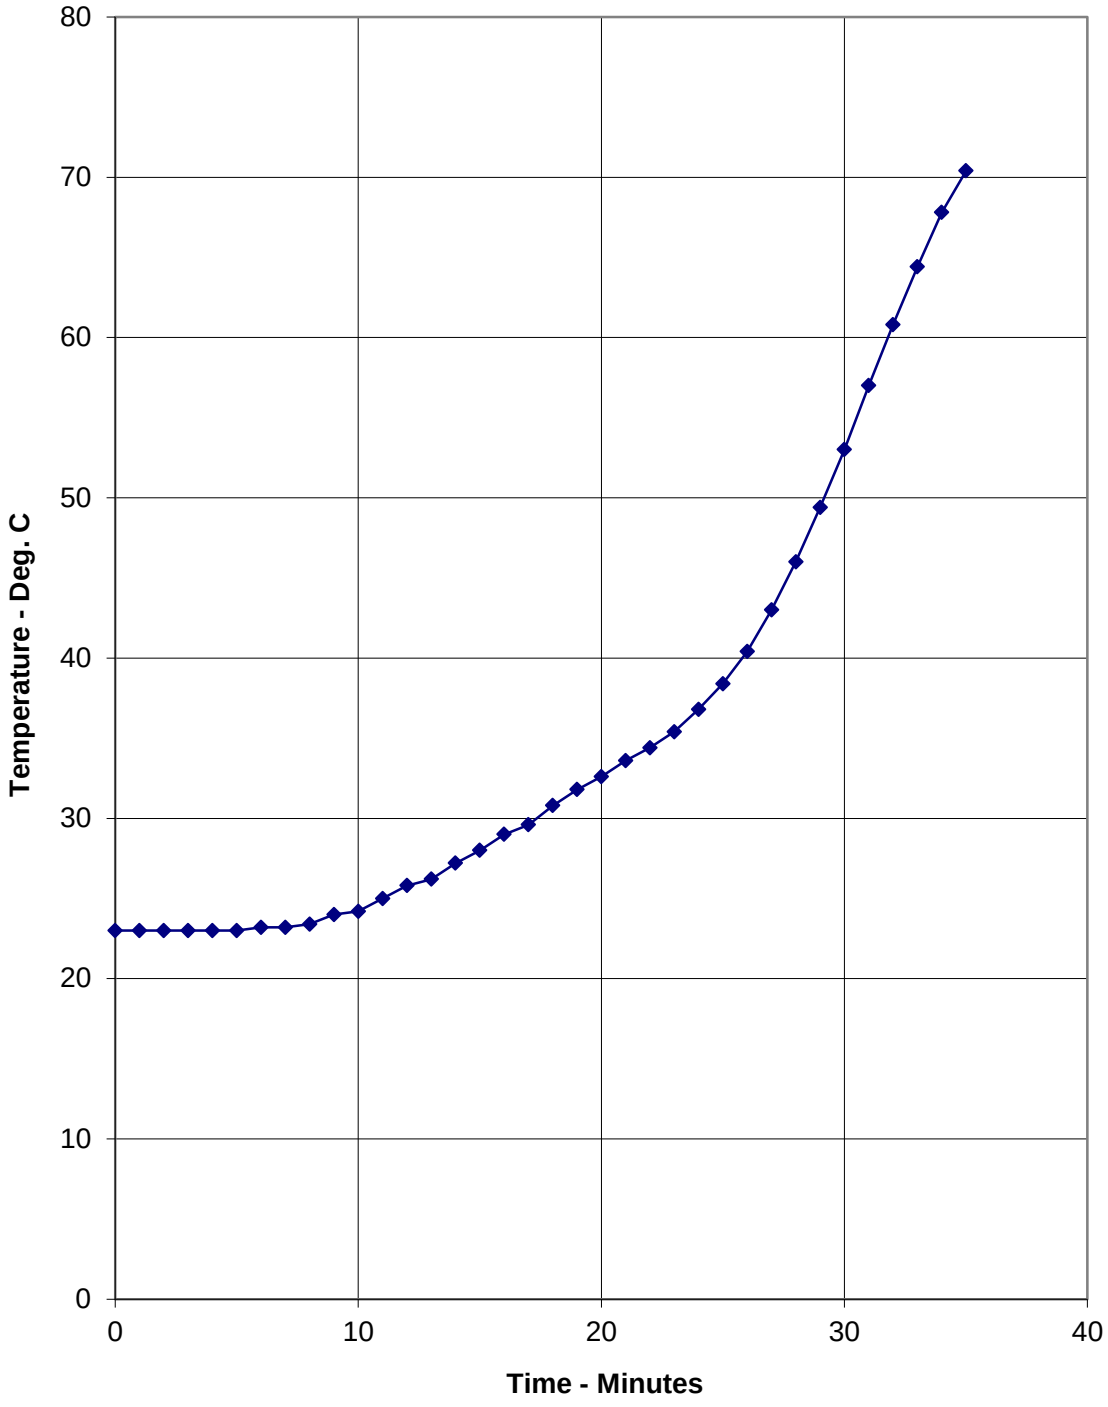
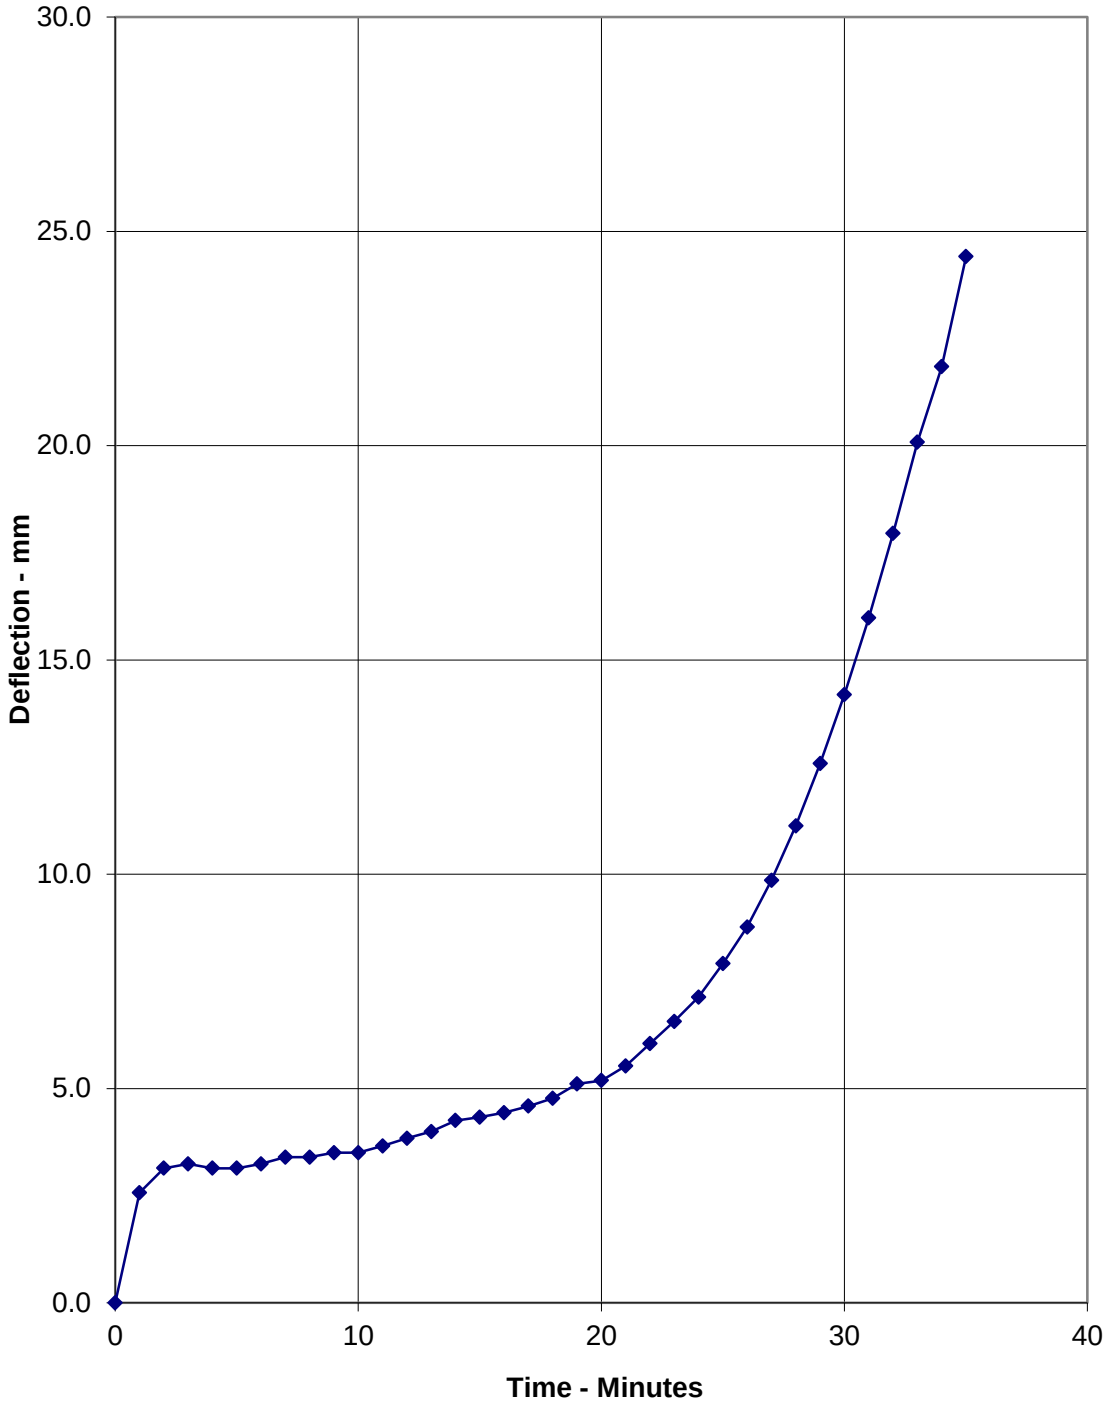
Graph showing specified and actual furnace temperatures



Graph showing mean unexposed surface temperature of the floor assembly



Graph showing the central vertical deflection of the floor assembly during the test



Load Calculations

1. **Physical Parameters of Timber Joists**

Measured Joist dimensions (d x b)	: 198 mm deep by 46 mm thick
Mean spacing (M)	: 600 mm
Effective span (L)	: 4400 mm
Timber grade of joists	: C16

2. **Parameters - BS 5268: Part 2: 1996**

Basic dry stress in bending	: 5.3 N/mm^2 (Table 7)
Modification factor for loading	: 1.1 (Table 2.9 (a))
Therefore working stress (F)	: 5.83 N/mm^2
Nominal density	: 370 kg/m^3

3. **Total Loading Required Per Joist**

Moment of Inertia (I)	: $bd^3/12$
	: $(46 \times 198^3)/12$
	: 29755836 mm^4
Distance from neutral axis to base of joist (y)	: 99 mm
Maximum bending stress	: FI/y
	: (5.83 x 29755836)/99
	: 1752288 N/mm^2
Also maximum bending stress	: $wL^2/8$
	: 1752288 N/mm^2
Where w	= Load per unit length
∴ w	= (1752288 x 8) /(4400 x 4400)
	= 0.724 N/mm
	= 724 N/m
∴ Total loading (W)	: 3185.6 N
	: 324.7 kg

4. **Dead Weight**

Combined weight of overall specimen:

Actual density of joist	: 360.2 kg/m^3
Actual density of floor boarding	: 652.2 kg/m^3
Actual density of ceiling board	: 930 kg/m^3
Effective width of floor supported per joist (m)	: 0.45 m
Weight of joist	: 14.4 kg
Weight of floorboard	: 37.9 kg
Weight of ceiling (3 layers of board)	: 36.8 kg
Total dead weight per joist	: 89.1 kg

5. **Imposed Load**

Imposed load per joist required : total load per joist - dead weight per joist
: 324.7 – 89.1
: 235.6 kg

Assuming even distribution of loading

Maximum imposed load per metre square : (235.6 x 9.81) / (4.4 x 0.6)
: 875.5 N/m^2
: 0.876 kN/m^2
: 89.3 kg/m^2

Performance Criteria and Test Results

Loadbearing Capacity

The limiting deflection and the limiting rate of deflection for the specimen, as specified by the Standard, are calculated as 202 mm and 10.1 mm per minute respectively. The allowable rate of deflection criteria is not applicable for the first 10 minutes of the test. This criterion was satisfied for the 35 minute test duration.

Integrity

It is required that specimens retain their separating function, without:

- Causing ignition of a cotton pad when applied
- Permitting the penetration of a gap gauge in the prescribed manner
- Sustained flaming on the unexposed surface
- Integrity failure also occurs simultaneously with loadbearing capacity failure.

These requirements were satisfied for the duration of the test:

Sustained flaming	35 minutes*
Gap gauge	35 minutes*
Cotton pad	35 minutes*

*The test duration. The test was discontinued after a period of 35 minutes

Insulation

It is required that the mean temperature rise of the unexposed surface shall not be greater than 140°C and that the maximum temperature rise shall not be greater than 180°C. Insulation failure occurs simultaneously with integrity failure. The insulation requirements were satisfied for the 35 minute test duration.

Ongoing Implications

Limitations

This report details the method of construction, the test conditions and the results obtained when the specific element of construction described herein was tested following the procedures outlined in BS EN 1363-1: 2012, and where appropriate BS EN 1363-2: 1999. Any significant deviation with respect to size, constructional details, loads, stresses, edge or end conditions other than those allowed under the field of direct application in the relevant test method is not covered by this report. Annex A of BS EN 1363-1: 2012, provides guidance information on the application of fire resistance tests and the interpretation of test data.

Because of the nature of fire resistance testing and the consequent difficulty in quantifying the uncertainty of measurement of fire resistance, it is not possible to provide a stated degree of accuracy of the result.

Conclusions

Evaluation against objective	A specimen of a loadbearing timber floor assembly protected by a direct fix ceiling assembly incorporating twenty three light fittings, has been subjected to a fire resistance test in accordance with the procedures given in BS EN 1365-2:2014. The specimen satisfied the performance requirements for the periods shown below:	
Loadbearing capacity		35 minutes*
Integrity performance	Sustained flaming	35 minutes*
	Gap Gauge	35 minutes*
	Cotton pad	35 minutes*
Insulation performance		35 minutes*

*The test was discontinued after a period of 35 minutes

Direct Field Of Application

The results are directly applicable to a similar untested floor construction provided the following is true:

The maximum moments and shear forces, which when calculated on the same basis as the test load, shall not be greater than those tested.

With respect to the ceiling system:

The size of panels of the ceiling lining shall not be changed.

The total area occupied by fixtures and fittings relative to the area of the ceiling lining is not increased and the maximum tested opening in the lining is not exceeded.

With respect to the cavity:

The height of the cavity or cavities is equal to or greater than the height tested.

No combustible or insulating material is added to the cavity unless the same amount (fire load) of combustible or insulating material was included in the test specimen.

Title:

The Fire Resistance Performance of a Loadbearing Timber Floor Assembly Protected by a Plasterboard Ceiling Designed to Provide 60 minutes Fire Resistance, Incorporating Twenty Three Downlight Fittings, When Tested Accordance with BS EN 1365 - 2: 2014

WF Report No: 385024-A

Prepared for:

Integral LED
Unit 6, Iron Bridge Close, Iron Bridge Business Park,
London, NW10 0UF, UK

Date:

26th January 2018

Notified Body No:

0833

UKAS TESTING
0249

This test report is additional to that issued as WF Test report No. 385024 and dated 15th December 2017. The original test report remains valid and is not replaced by this additional test report.

Summary

Objective

To determine the fire resistance performance of a loadbearing timber floor assembly protected by a plasterboard ceiling designed to provide 60 minutes fire resistance, incorporating twenty three down light fittings, when tested in accordance with BS EN 1365 - 2: 2014.

Sponsor

Integral LED
Unit 6, Iron Bridge Close, Iron Bridge Business Park, London, NW10 0UF, UK

Summary of Tested Assembly

Briefly, the timber floor had overall nominal dimensions of 4500 mm long by 3000 mm wide and comprised softwood timber joists at 600 mm centres. The upper surface of the floor comprised nominally 22 mm thick tongue and grooved chipboard flooring.

The floor assembly was protected on its underside by a direct fixed ceiling, formed from two layers of 12.5 mm thick British Gypsum Fireline plasterboard, the ceiling was screw fixed to the underside of the floor joists.

The floor supported an evenly distributed load of 0.784 kN/m^2.

The ceiling incorporated 22 down lighter light fittings, 2 of which are subject to this test report and were referenced as follows:

Test Ref.	Model Ref.	Description
I	ILDLFR70AXXX	Round, fixed, LED recessed downlight
M	ILDLFR92CXXX	Round, tiltable, LED recessed downlight
A-H, J-L and N-W	Items reported separately	

Test Results:

Loadbearing Capacity	66 minutes*
Integrity Performance	
Sustained flaming	66 minutes*
Gap gauge	66 minutes*
Cotton pad	66 minutes*
Insulation	66 minutes*

*The test was discontinued after a period of 66 minutes.

Date of Test 24th August 2017

Report Issued

Date : 26th January 2018

This test report is additional to that issued as WF Test report No. 385024 and dated 15th December 2017. The original test report remains valid and is not replaced by this additional test report.

CONTENTS **PAGE NO.**

Test Procedure

Introduction

The specimen tested was of a loadbearing timber floor construction protected by a direct fix ceiling assembly. The test was conducted in accordance with BS EN 1365-2: 2014, 'Fire resistance tests for loadbearing elements – Part 2: Floors and Roofs'. This test report should be read in conjunction with that Standard and with BS EN 1363-1: 2012, 'Fire resistance tests part 1, general requirements' and BS EN 1363-2: 1999, 'Fire resistance tests part 2, alternative and additional procedures'.

The purpose of the test was to evaluate the performance of a timber floor construction protected by a ceiling of known fire resistance, when incorporating down lighter light fitting assemblies.

The specimen was judged on its ability to comply with the performance criteria for loadbearing capacity, integrity and insulation, as required by BS EN 1365-2: 2014.

Fire Test Study Group/EGOLF

Certain aspects of some fire test specifications are open to different interpretations. The Fire Test Study Group and EGOLF have identified a number of such areas and have agreed Resolutions which define common agreement of interpretations between fire test laboratories which are members of the Groups. Where such Resolutions are applicable to this test they have been followed.

Instruction To Test

The test was conducted on the 24th August 2017 at the request of **Integral LED,** the test sponsor.

Test Assembly Construction

A comprehensive description of the test construction is given in the Schedule of Components. The description is based on a detailed survey of the specimen and information supplied by the sponsor of the test.

Installation

Representatives of **Exova Warringtonfire** assembled the floor construction and installed the downlighters between the 21st and 24th August 2017.

Conditioning

The specimens' storage, construction, and test preparation took place in the test laboratory over a total combined time of 4 days. Throughout this period of time both the temperature and the humidity of the laboratory were measured and recorded as being within a range of from 18°C to 26.5°C and 55.5% to 80% respectively.

Schedule of Components

(Refer to Figures 1 to 4)
(All values are nominal unless stated otherwise)
(All other details are as stated by the sponsor)

Item		Description
1. Timber Floor		
1.1 Floor Joists		
Material	:	British Home-grown, rough sawn softwood, kiln dried
Grade	:	C24, to BS EN 519
Density	:	511 kg/m^3
Size	:	45 mm x 197 mm
Joist centres	:	600 mm
1.2 Noggins		
Material	:	British Home-grown, rough sawn softwood, kiln dried
Grade	:	C24, to BS EN 519
Density	:	511 kg/m^3
Size	:	65 mm x 45 mm
Joist centres	:	1200 mm
1.3 Floor Boards		
Material	:	Flooring grade tongue and groove chipboards
Reference	:	FSC E1 P5
Thickness	:	22 mm
Size	:	600 mm wide
Fixing	:	Fixed in a single layer with 6 mm diameter x 60 mm long countersunk steel screws to floor joists at 300 mm centres
1.4 Ceiling Boards		
Manufacturer	:	British Gypsum
Type / reference	:	Gyproc Fireline Wallboard
Density	:	803 kg/m^3
Thickness	:	25 mm, 2 layers of 12.5 mm thick
Fixing		
i. method	:	The boards were screw fixed to the soffit of the joists with all joints in the second layer staggered with respect to those of the first layer
ii. fixings	:	Drywall self drill and tapping screws 38 mm and 50 mm long for the 1st and 2nd board layers respectively
iii. frequency	:	150 mm centres along joints and 150 mm to the perimeter of the ceiling

Instrumentation

General	The instrumentation was provided in accordance with the requirements of the Standard.
Furnace	The furnace was controlled so that its mean temperature complied with the requirements of BS EN 1363-1: 2012, using eight plate thermometers distributed over a plane 100 mm from the underside of the test construction.
Thermocouple Allocation	Thermocouples were provided to monitor the unexposed surface of the floor assembly and the output of all instrumentation was recorded at no less than one minute intervals as follows:
Thermocouples 212 to 216	At five positions on the unexposed surface of the floor assembly, one approximately at the centre and one at approximately the centre of each quarter section.
Thermocouples 222 to 227	At six positions on the unexposed surface of the floor assembly, positioned adjacent to joints in the floor boarding.
Thermocouples 217 to 221	At five positions in the air cavity of the floor assembly, one approximately at the centre and one at approximately the centre of each quarter section
	The locations and reference numbers of the various unexposed surface and internal thermocouples are shown in Figure 1.
Roving Thermocouple	A roving thermocouple was available to measure temperatures on the unexposed surface of the specimen at any position which might appear to be hotter than the temperatures indicated by the fixed thermocouples.
Furnace Pressure	After the first five minutes of testing and for the remainder of the test. The calculated pressure differential relative to the laboratory atmosphere 100 mm away from the underside of the assembly was 20(+0, -5) Pa between 5 and 10 minutes of testing and 20(+0, -3) Pa after 10 minutes of testing and for the remainder of the test.
Loadbearing Capacity Criteria	Linear deflection transducer was provided at the approximate centre on the unexposed surface of the specimen to record its vertical deflection.
Integrity Criteria	Cotton pads and gap gauges were available to evaluate the integrity of the floor assembly.

Test Observations

Time		All observations are from the unexposed face unless noted otherwise.
mins	**secs**	The ambient air temperature in the vicinity of the test construction was 24ºC at the start of the test with a maximum variation of -1ºC during the test.
00	**00**	**The test commences.**
08	**24**	Steam/smoke release is observed from the latitude edges of the specimen.
11	**24**	When viewed from the exposed face, the paper face of the boards are observed charring away as small hairline cracks begin to form on the boards. All light fittings now appear to have come away from the specimen
18	**24**	Steam/smoke release observed from the latitude edges increases
21	**36**	When viewed form the exposed face, gaps are observed forming between the joints of the plasterboard.
51	**59**	Steam/smoke release observed from latitude edges continues and slowly increases.
60	**00**	When viewed form the exposed face, the gaps between the joints of plasterboard are observed continuing to expand..
66	**00**	**The test is discontinued.**

Load Calculations

1. **Physical Parameters of Timber Joists**

Measured Joist dimensions (d x b)	: 198 mm deep by 46 mm thick
Mean spacing (M)	: 600 mm
Effective span (L)	: 4400 mm
Timber grade of joists	: C16

2. **Parameters - BS 5268: Part 2: 1996**

Basic dry stress in bending	: 5.3 N/mm^2 (Table 7)
Modification factor for loading	: 1.1 (Table 2.9 (a))
Therefore working stress (F)	: 5.83 N/mm^2
Nominal density	: 370 kg/m^3

3. **Total Loading Required Per Joist**

Moment of Inertia (I)	: $bd^3/12$
	: $(46 \times 198^3)/12$
	: 29755836 mm^4
Distance from neutral axis to base of joist (y)	: 99 mm
Maximum bending stress	: FI/y
	: (5.83 x 29755836)/99
	: 1752288 N/mm^2
Also maximum bending stress	: $wL^2/8$
	: 1752288 N/mm^2
Where w	= Load per unit length
∴ w	= (1752288 x 8) /(4400 x 4400)
	= 0.724 N/mm
	= 724 N/m
∴ Total loading (W)	: 3185.6 N
	: 324.7 kg

4. **Dead Weight**

Combined weight of overall specimen:

Actual density of joist	: 360.2 kg/m^3
Actual density of floor boarding	: 652.2 kg/m^3
Actual density of ceiling board	: 930 kg/m^3
Effective width of floor supported per joist (m)	: 0.45 m
Weight of joist	: 14.4 kg
Weight of floorboard	: 37.9 kg
Weight of ceiling (3 layers of board)	: 61.0 kg
Total dead weight per joist	: 113.7 kg

5. **Imposed Load**

Imposed load per joist required : total load per joist - dead weight per joist
: 324.7 – 113.7
: 211 kg

Assuming even distribution of loading

Maximum imposed load per metre square : (235.6 x 9.81) / (4.4 x 0.6)
: 784.1 N/m^2
: 0.784 kN/m^2
: 80 kg/m^2

Performance Criteria and Test Results

Loadbearing Capacity

The limiting deflection and the limiting rate of deflection for the specimen, as specified by the Standard, are calculated as 202 mm and 10.1 mm per minute respectively. The allowable rate of deflection criteria is not applicable for the first 10 minutes of the test. This criterion was satisfied for the 66 minute test duration.

Integrity

It is required that specimens retain their separating function, without:

- Causing ignition of a cotton pad when applied
- Permitting the penetration of a gap gauge in the prescribed manner
- Sustained flaming on the unexposed surface
- Integrity failure also occurs simultaneously with loadbearing capacity failure.

These requirements were satisfied for the duration of the test:

Sustained flaming	66 minutes*
Gap gauge	66 minutes*
Cotton pad	66 minutes*

*The test duration. The test was discontinued after a period of 66 minutes

Insulation

It is required that the mean temperature rise of the unexposed surface shall not be greater than 140°C and that the maximum temperature rise shall not be greater than 180°C. Insulation failure occurs simultaneously with integrity failure. The insulation requirements were satisfied for the 66 minute test duration.

Ongoing Implications

Limitations

This report details the method of construction, the test conditions and the results obtained when the specific element of construction described herein was tested following the procedures outlined in BS EN 1363-1: 2012, and where appropriate BS EN 1363-2: 1999. Any significant deviation with respect to size, constructional details, loads, stresses, edge or end conditions other than those allowed under the field of direct application in the relevant test method is not covered by this report. Annex A of BS EN 1363-1: 2012, provides guidance information on the application of fire resistance tests and the interpretation of test data.

Because of the nature of fire resistance testing and the consequent difficulty in quantifying the uncertainty of measurement of fire resistance, it is not possible to provide a stated degree of accuracy of the result.

Conclusions

Evaluation against objective	A specimen of a loadbearing timber floor assembly protected by a direct fix ceiling assembly incorporating twenty three light fittings, has been subjected to a fire resistance test in accordance with the procedures given in BS EN 1365-2:2014. The specimen satisfied the performance requirements for the periods shown below:	
Loadbearing capacity		66 minutes*
Integrity performance	Sustained flaming	66 minutes*
	Gap Gauge	66 minutes*
	Cotton pad	66 minutes*
Insulation performance		66 minutes*

*The test was discontinued after a period of 66 minutes

Direct Field Of Application

The results are directly applicable to a similar untested floor construction provided the following is true:

The maximum moments and shear forces, which when calculated on the same basis as the test load, shall not be greater than those tested.

With respect to the ceiling system:

The size of panels of the ceiling lining shall not be changed.

The total area occupied by fixtures and fittings relative to the area of the ceiling lining is not increased and the maximum tested opening in the lining is not exceeded.

With respect to the cavity:

The height of the cavity or cavities is equal to or greater than the height tested.

No combustible or insulating material is added to the cavity unless the same amount (fire load) of combustible or insulating material was included in the test specimen.

Title:

The Fire Resistance Performance of a Specimen of a Loadbearing Timber Floor Assembly Protected by a Plasterboard Ceiling Designed to Provide 90 minutes Fire Resistance, Incorporating Sixteen Downlight Light Fittings, Tested in Accordance with BS 476: Part 21: 1987, Clause 7

WF Report No:

388542A Issue 2

Prepared for:

Integral LED
Unit 6, Iron Bridge Close, Iron Bridge Business Park,
London, NW10 0UF, UK

Date:

26th January 2018

Notified Body No:

0833

0249

This test report is additional to that issued as WF Test report No. 388542 and dated 15th December 2017. The original test report remains valid and is not replaced by this additional test report.

Summary

Objective

To determine the fire resistance performance of a loadbearing timber floor assembly protected by a plasterboard ceiling designed to provide 90 minutes fire resistance, incorporating sixteen downlight light fittings, when tested in accordance with Clause 7 of BS 476: Part 21: 1987.

Sponsor

Integral LED
Unit 6, Iron Bridge Close, Iron Bridge Business Park, London, NW10 0UF,

Summary of Tested Assembly

Briefly, the timber floor had overall nominal dimensions of 4400 mm long by 3000 mm wide and comprised softwood timber joists at 600 mm centres. The upper surface of the floor comprised nominally 22 mm thick tongue and grooved chipboard flooring.

The floor assembly was protected on its underside by a direct fixed ceiling, formed from two layers of 15 mm thick British Gypsum Fireline plasterboard, the ceiling was screw fixed to the underside of the floor joists.

The floor supported an evenly distributed load of 0.822 kN/m^2.

The ceiling incorporated sixteen downlight light fittings, two of which are subject to this test report and were referenced as follows:

Test Ref.	Model Ref.	Description
K	ILDLFR92CXXX	Round LED recessed down light, 92 mm diameter cut-out
M	ILDLFR70AXXX	Round LED recessed down light, 70 mm diameter cut-out
A – J, L and N - P	Items reported separately	

Test Results:

Loadbearing Capacity	93 minutes*
Integrity	93 minutes*
Insulation	93 minutes*

*The test was discontinued after a period of 93 minutes

Date of Test 16th September 2017

Test Procedure

Introduction

The specimen tested was of a loadbearing construction. The test was conducted in accordance with Clause 7 of BS 476: Part 21: 1987, 'Methods for determination of the fire resistance of loadbearing elements of construction'. This test report should be read in conjunction with that Standard and with BS 476: Part 20: 1987, 'Method for determination of the fire resistance of elements of construction (general principles)'.

The purpose of the test was to evaluate the performance of a timber floor construction protected by a ceiling of previously proven fire resistance, when incorporating down lighter fitting assemblies.

The specimen was judged on its ability to comply with the performance criteria for loadbearing capacity, integrity and insulation, as required by BS 476: Part 21: 1987, Clause 7.

Fire Test Study Group/EGOLF

Certain aspects of some fire test specifications are open to different interpretations. The Fire Test Study Group and EGOLF have identified a number of such areas and have agreed Resolutions which define common agreement of interpretations between fire test laboratories which are members of the Groups. Where such Resolutions are applicable to this test they have been followed.

Instruction To Test

The test was conducted on the 16th September 2017 at the request of **Integral LED**, the test sponsor.

Test Assembly Construction

A comprehensive description of the test construction is given in the Schedule of Components. The description is based on a detailed survey of the specimens and information supplied by the sponsor of the test.

Installation

Representatives of Warringtonfire assembled the floor construction and installed the down lighters on the 14th September 2017

Conditioning

The floor construction and downlighters specimens' storage, construction, and test preparation took place in the test laboratory over a total combined time of 5 days. Throughout this period of time both the temperature and the humidity of the laboratory were measured and recorded as being within a range of from 9°C to 13°C and 50% to 62% respectively.

Schedule of Components

(Refer to Figures 1 to 4)
(All values are nominal unless stated otherwise)
(All other details are as stated by the sponsor)

Item		Description
1. Timber Floor		
1.1 Floor Joists		
Material	:	British Home-grown, rough sawn softwood, kiln dried
Grade	:	C16, to BS EN 519
Density	:	511 kg/m^3
Size	:	45 mm x 197 mm
Joist centres	:	450 mm
1.2 Noggins		
Material	:	British Home-grown, rough sawn softwood, kiln dried
Grade	:	C24, to BS EN 519
Density	:	511 kg/m^3
Size	:	65 mm x 45 mm
Joist centres	:	1200 mm
1.2 Floor Boards		
Material	:	Flooring grade tongue and groove chipboards
Reference	:	FSC E1 P5
Thickness	:	22 mm
Size	:	450 mm wide
Fixing	:	Fixed in a single layer with 6 mm diameter x 60 mm long countersunk steel screws to floor joists at 300 mm centres
1.3 Ceiling Boards		
Manufacturer	:	British Gypsum
Type / reference	:	Gyproc Fireline Wallboard
Density	:	803 kg/m^3
Thickness	:	30 mm, 2 layers of 15 mm thick
Fixing		
i. method	:	The boards were screw fixed to the soffit of the joists with all joints in the second layer staggered with respect to those of the first layer
ii. fixings	:	Drywall self drill and tapping screws 38 mm and 50 mm long for the 1st and 2nd board layers respectively
iii. frequency	:	150 mm centres along joints and 150 mm to the perimeter of the ceiling

16. Specimen 0	:	Item reported separately
17. Specimen P	:	Item reported separately

Instrumentation

General

The instrumentation was provided in accordance with the requirements of the Standard.

Furnace

The furnace was controlled so that its mean temperature complied with the requirements of BS 476: Part 20: 1987, Clause 3.1. using eight mineral insulated thermocouples distributed over a plane 100 mm from the underside of the ceiling.

Thermocouple Allocation

Thermocouples were provided to monitor the unexposed surface of the floor assembly and the output of all instrumentation was recorded at no less than one minute intervals as follows:

The locations and reference numbers of the various unexposed surface and internal thermocouples are shown in Figures 1 and 2.

Roving Thermocouple

A roving thermocouple was available to measure temperatures on the unexposed surface of the floor at any position which might appear to be hotter than the temperatures indicated by the fixed thermocouples.

Integrity criteria

Cotton pads and gap gauges were available to evaluate the impermeability of the test construction to hot gases.

Furnace Pressure

After the first five minutes of testing and for the remainder of the test, the furnace atmospheric pressure was controlled so that it complied with the requirements of BS 476: Part 20: 1987, Clause 3.2.2. The calculated pressure differential relative to the laboratory atmosphere at a position 100 mm below the underside of the assembly was 20 (+0, -2) Pa.

Test Observations

Time		All observations are from the unexposed face unless noted otherwise.
mins	secs	The ambient air temperature in the vicinity of the test construction was 19ºC at the start of the test with a maximum variation of +2ºC during the test.
00	00	**The test commences.**
12	34	Small amount of smoke issue from both ends of the floor.
15	43	**Viewed from exposed face:** Jointing tape detached from all joints in the plasterboard.
20	45	**Viewed from exposed face:** Bezels from downlighters I and D detached.
23	23	Temperature above downlighter A reaches 200ºC.
26	17	**Viewed from exposed face:** Downlighter J detaches.
30	00	No significant visible change to unexposed face.
60	00	No significant visible change to unexposed face.
60	50	**Viewed from exposed face:** All joints in first layer of plasterboard widened to approximately 3mm.
62	45	**Viewed from exposed face:** Joint in first layer of plasterboard at approximately mid-length of the assembly widened to approximately 5mm.
70	07	**Viewed from exposed face:** Downlighter N detached from the assembly. Cavity temperature directly above 500ºC. Hole through the plasterboard is evident.
72	39	Smoke release from both floor ends significantly increased in volume.
74	21	**Viewed from exposed face:** Joint in the first layer of plasterboard at approximately mid-length of the assembly widened to approximately 10mm.

Time		
mins	secs	
78	17	**Viewed from exposed face:** Big chunk of first layer of plasterboard detached from approximately the centre of the assembly.
80	06	**Viewed from exposed face:** First layer of plasterboard adjacent to downlighter N position has sagged down by approximately 15mm.
81	54	**Viewed from exposed face:** Big chunk of first layer of plasterboard detached from approximately the centre of the assembly.
85	26	**Viewed from exposed face:** Approximately 50% of the first layer of the plasterboard is detaching from the ceiling.
86	40	**Viewed from exposed face:** Unable to see inside due to smoke within furnace chamber. Cavity temperatures in excess of 700ºC.
90	00	Specimen is still satisfying loadbearing capacity, integrity and insulation criteria allowing test to continue.
93	00	**Test discontinued.**

Test Photographs

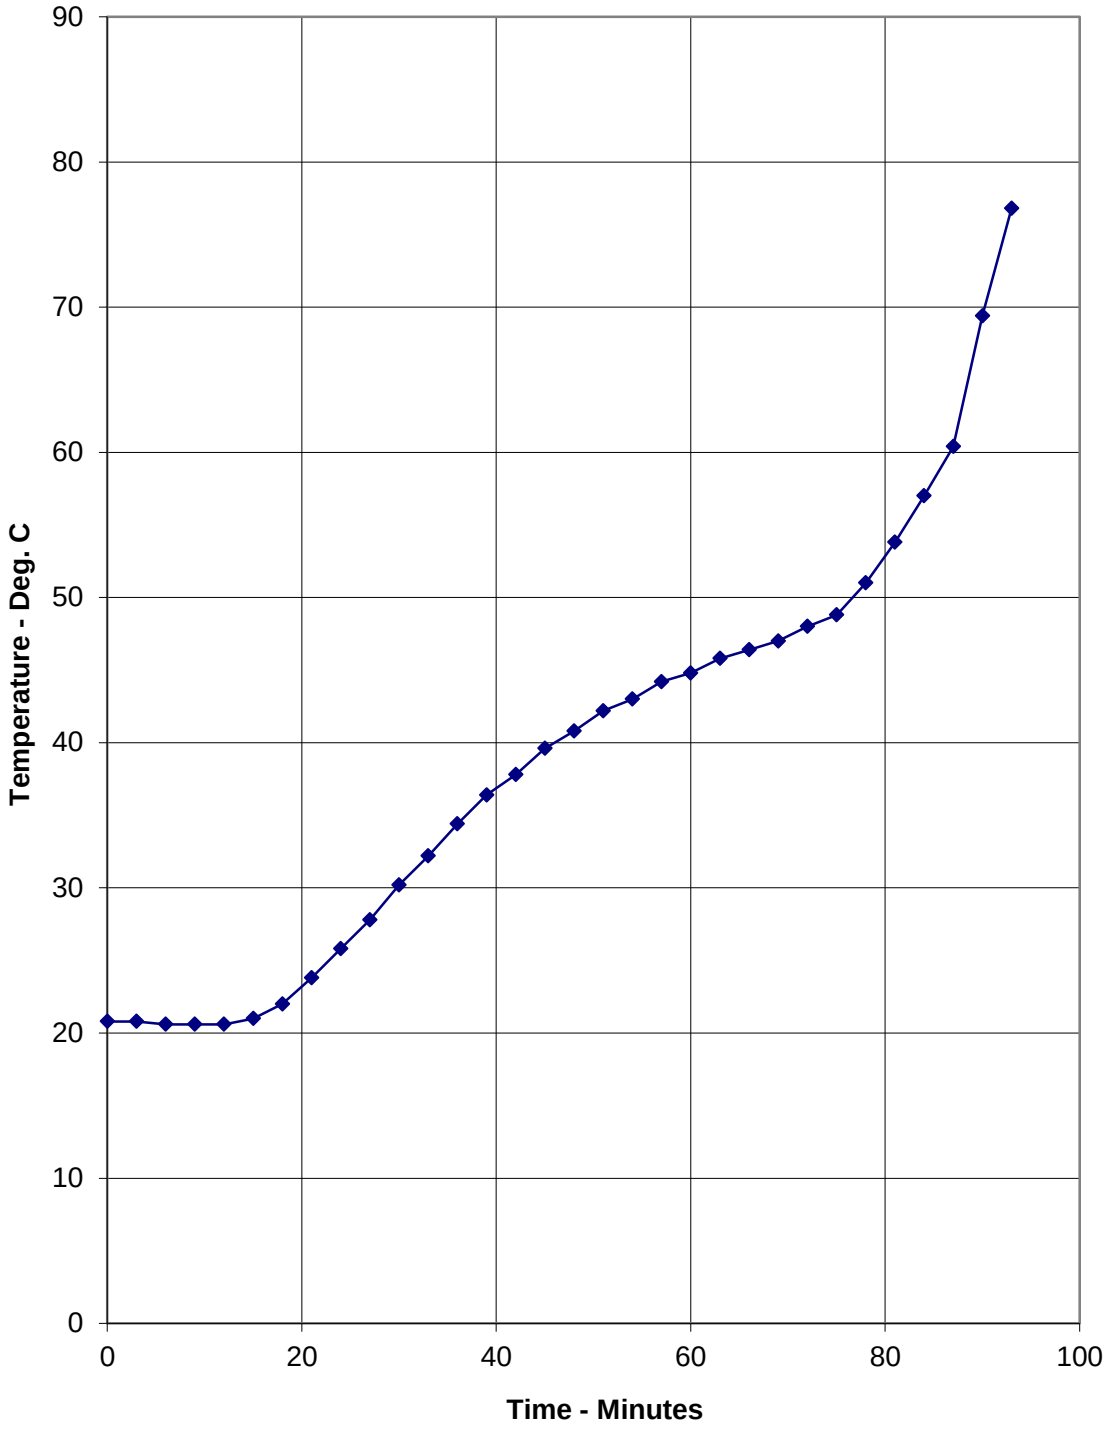
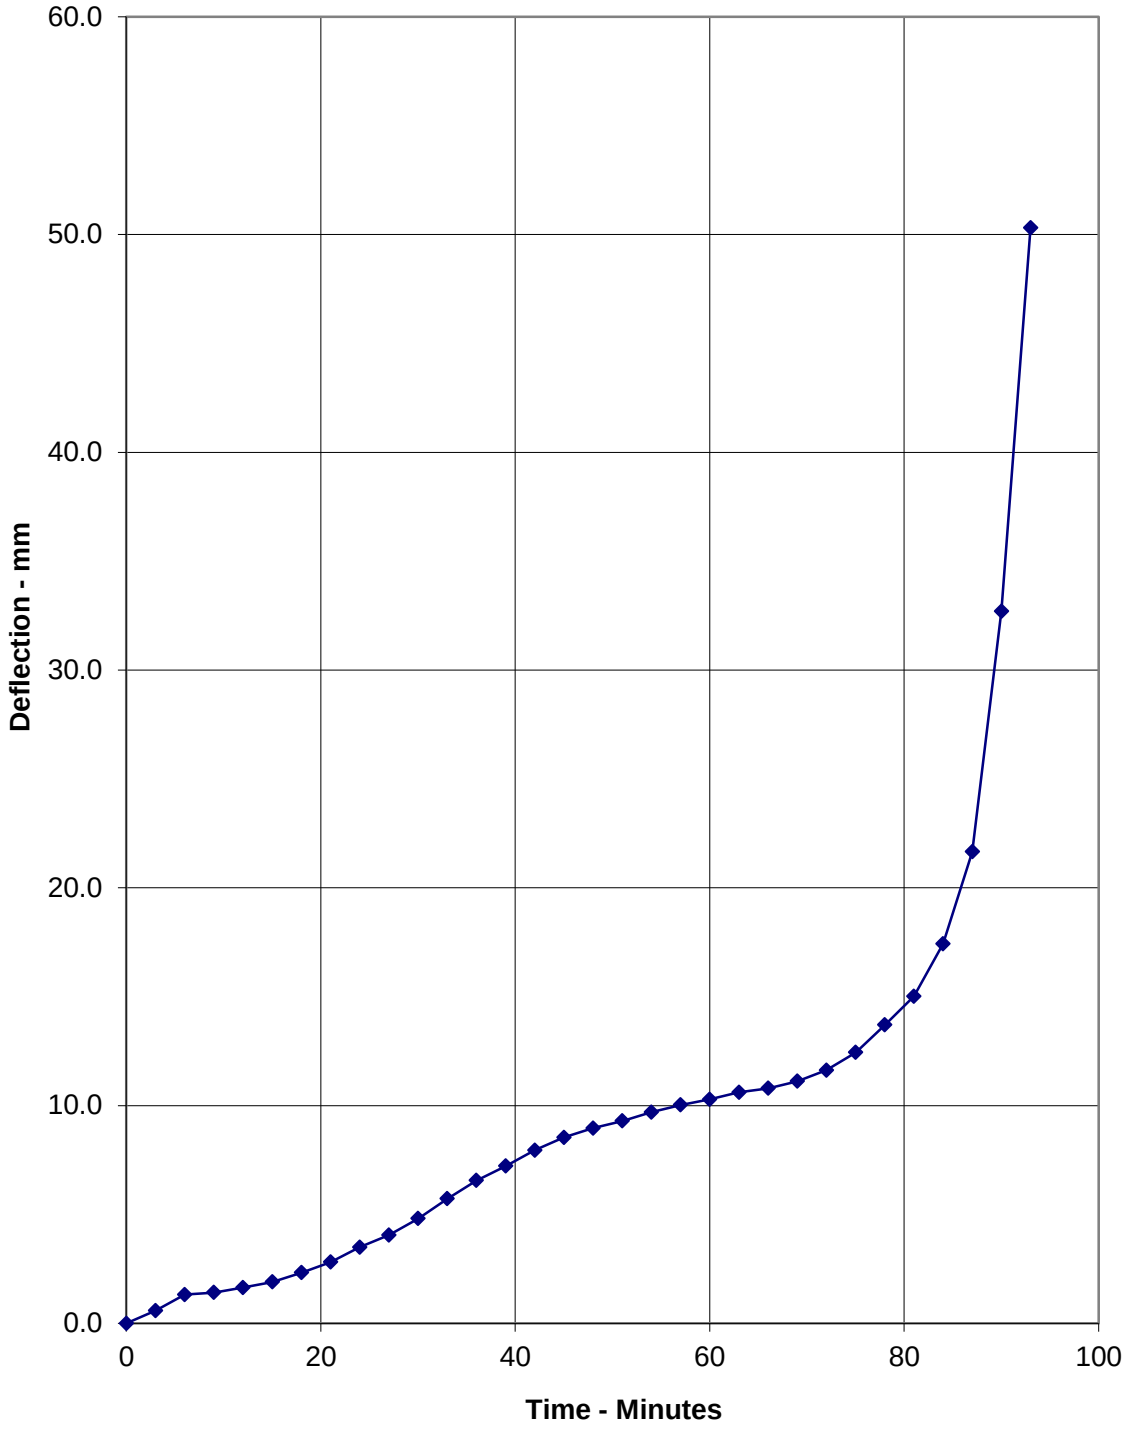
Graph showing mean unexposed surface temperature of the floor assembly



Graph showing the central vertical deflection of the floor assembly during the test



Load Calculations

1. **Physical Parameters of Timber Joists**

Measured Joist dimensions (d x b)	: 195 mm deep by 38 mm thick
Mean spacing (M)	: 450 mm
Effective span (L)	: 4400 mm
Timber grade of joists	: C16

2. **Parameters - BS 5268: Part 2: 2002**

Basic dry stress in bending	: 5.3 N/mm^2 (Table 7)
Modification factor for loading	: 1.1 (Table 2.9 (a))
Therefore working stress (F)	: 5.83 N/mm^2
Nominal density	: 370 kg/m^3

3. **Total Loading Required Per Joist**

Moment of Inertia (I)	: $bd^3/12$
	: $(38 \times 195^3)/12$
	: 23480437.5 mm^4
Distance from neutral axis to base of joist (y)	: 97.5 mm
Maximum bending stress	: FI/y
	: (5.83 x 23480437.5)/97.7
	: 1404009.75 N/mm^2
Also maximum bending stress	: $wL^2/8$
	: 1404009.75 N/mm^2
Where w	= Load per unit length
∴ w	= (1404009.75 x 8) / (4400 x 4400)
	= 0.580 N/mm
	= 580 N/m
∴Total loading (W)	: 2552 N
	: 260.2 kg

4. **Dead Weight**

Combined weight of overall specimen:

Actual density of joist	: 360.2 kg/m^3
Actual density of floor boarding	: 652.2 kg/m^3
Actual density of ceiling board	: 911.7 kg/m^3
Effective width of floor supported per joist (m)	: 0.45 m
weight of joist	: 11.7 kg
weight of floorboard	: 28.4 kg
weight of ceiling (two layers)	: 54.15 kg
Total dead weight per joist	: 94.2 kg

5. **Imposed Load**

Imposed load per joist required : total load per joist - dead weight per joist
: 260.2 – 94.2
: 166 kg

Assuming even distribution of loading

Maximum imposed load per metre square : (166 x 9.81) / (4.4 x 0.45)
: 822.45 N/m^2
: 0.822 kN/m^2
: 83.8 kg/m^2

Performance Criteria and Test Results

Loadbearing Capacity

The maximum allowable deflection and the maximum rate of deflection for the specimen, as specified by the Standard, are calculated as 200 mm and 9.11 mm per minute respectively. The allowable rate of deflection is not applicable until the deflection exceeds $^{1}/_{30}$ of the span (i.e. 140 mm). The test construction satisfied this requirement for the total test duration of 93 minutes.

Integrity

It is required that there is no collapse of the specimen floor assembly, no sustained flaming on the unexposed surface and no loss of impermeability. The test construction satisfied this requirement for the total test duration of 93 minutes.

Insulation

It is required that the mean temperature rise of the unexposed surface shall not be greater than 140˚C and that the maximum temperature rise shall not be greater than 180˚C. Insulation failure also occurs simultaneously with integrity failure. The test construction satisfied this requirement for the total test duration of 93 minutes.

Ongoing Implications

Limitations

The results relate only to the behaviour of the floor/ceiling assembly with downlighter specimens as an element of construction under the particular conditions of test. They are not intended to be the sole criteria for assessing the potential fire performance of the element in use, nor do they reflect the actual behaviour in fires.

The test results relate only to the specimen light fittings tested. Appendix A of BS 476: Part 20: 1987 provides guidance information on the application of fire resistance tests and the interpretation of test data. Application of the result to assemblies of different dimensions or supported in other manners or incorporating different components should be the subject of a design appraisal.

Review

The specification and interpretation of fire test methods are the subject of ongoing development and refinement. Changes in associated legislation may also occur. For these reasons it is recommended that the relevance of test reports over five years old should be considered by the user. The laboratory that issued the report will be able to offer, on behalf of the legal owner, a review of the procedures adopted for a particular test to ensure that they are consistent with current practices, and if required may endorse the test report.

Conclusions

Evaluation against objective

A specimen of a loadbearing timber floor assembly, protected by a plasterboard ceiling incorporating sixteen down lighter fittings has been subjected to a fire resistance test in accordance with BS 476: Part 21: 1987, Clause 7.

The evaluation of the assembly against the requirements of BS 476: Part 21: 1987, Clause 7 showed that it satisfied the requirements the periods stated below:

Test Results:

Loadbearing Capacity	93 minutes*
Integrity	93 minutes*
Insulation	93 minutes*

*The test was discontinued after a period of 93 minutes.
